

What is claimed:

1. A member for attachment to a walking member for providing illumination to the ground across which said walking member is to be moved, said walking member having a cylindrical handle intended to be gripped by the human hand, said member comprising
 - a body configured to be gripped by a human hand,
 - said body having an inner surface, and an open end,
 - a light producing means producing a beam of light on said body,
 - said light producing means fitted on said body,
 - means for retaining a battery in a portion of said body,
 - means for attaching said body to said cylindrical handle of said walking member, and
 - said light producing means mounted on said body to direct said beam of light toward said ground across which said walking member is moveable.
2. The member of claim 1 and further comprising a switch for turning said light producing means on and off.
3. The member of claim wherein said body is a tubular member.
4. The member of claim 1 wherein said body has a first body portion and a second body portion wherein said first and second body portions may be assembled around said cylindrical handle.

5. The member of claim 1 wherein said body is made of a semi-flexible material with a memory and said body is tubular with an elongate slit running the length of tubular body forming surfaces that may be separated from each other to position said body around said handle.
